NORTHSTAR PROCESS WORKS

TRAINING EXAMPLE - FICTIONAL COMPANY POLICY

Abnormal Equipment Condition Reporting and Maintenance Control

Document ID: NPW-HSE-OPS-POL-004

Revision: 1 | Effective date: 28 September 2026 | Review date: 28 September 2027

Document owner: Operations and Maintenance Manager

Approval status: Sample only - not approved for use at a real facility

1. Purpose

This fictional policy sets expectations for reporting abnormal equipment conditions, communicating risk, and controlling follow-up work. It is provided as synthetic retrieval material for the industrial RAG demonstration.

2. Scope

The policy applies, within the fictional Northstar Process Works training scenario, to employees and contractors who observe or report abnormal process or mechanical conditions. It does not replace local law, emergency response plans, operating procedures, permit-to-work rules, or equipment-specific energy-control procedures.

3. Policy

Personnel shall promptly report abnormal noise, vibration, leakage, odor, smoke, unexpected temperature, alarms, or loss of expected equipment performance through the site reporting channel. Reports should identify the asset tag and location, time observed, change or trend, relevant existing indications, and alarms or event references when known.

Personnel shall not diagnose a failure from a single symptom or take corrective action outside their training, role, and approved operating procedure. Do not approach a suspected release or unsafe condition to collect additional information. Follow the site emergency response process and notify the control room or designated supervisor when an immediate hazard may exist.

Inspection, adjustment, shutdown, isolation, repair, and return to service shall be performed only by authorized personnel under current approved procedures and required permits. Equipment-specific isolation and verification shall use the approved energy-control documents; this policy does not define isolation points or steps.

4. Reporting and response

The receiving operations representative records the report, acknowledges it to the reporter, and assesses it under the applicable operating and abnormal-situation procedures. Operations determines immediate operating actions within its authority and initiates escalation when conditions worsen, alarms activate, or risk is uncertain.

The maintenance planner creates or updates the work request, verifies equipment identity against controlled records, assigns priority under the site prioritization process, and identifies missing technical documents. Work shall remain on hold until required scope, risk review, permits, isolation planning, and approvals are complete.

After work, the responsible supervisor records findings, work performed, parts, test results against approved criteria, unresolved defects, and the authorized return-to-service decision in the maintenance management system.

5. Roles

Reporter: communicate observations promptly and accurately; do not guess at cause or exceed assigned authority.

Control room / operations: acknowledge and log reports; apply current operating and emergency procedures; coordinate safe assessment and escalation.

Maintenance planner: verify asset identity and document revision; plan work using approved technical references; keep work on hold when prerequisites are missing.

Authorized maintenance personnel: perform approved work under the applicable permit, energy-control procedure, and job plan; report scope changes and stop when actual conditions differ from the plan.

Area supervisor: ensure responsibilities, competency, required approvals, and closeout are addressed under the site management system.

6. Records and document control

Condition reports, work orders, permits, inspection records, and closeout evidence shall be retained in the designated site systems under the document-retention schedule. Controlled procedures and drawings shall be accessed from the approved document-control system. Printed or locally copied versions must be checked for current revision before use.

This sample PDF is an uncontrolled training artifact. "Northstar Process Works" is fictional. Document ID, dates, roles, and policy statements are illustrative and do not represent an actual company, approved policy, legal advice, or facility authorization.

7. Related controlled documents (examples; not included)

- Site emergency response and abnormal operating procedures
- Equipment-specific energy-control / isolation procedure and permit-to-work standard
- Current approved P&ID, equipment datasheet, and manufacturer documentation
- Maintenance management and records-retention procedures
